

BudgetFitzz

Performance Analysis and Strategy Revision

Evidence-linked analytics, a seven-day pilot, seven finished local assets, and a validated agentic platform.

150	90.0%	5 + 2	INR 0
historical items	promotional baseline	posts + videos	paid generation

PROJECT ASSUMPTION

BudgetFitzz is treated as an affordable men's fashion discovery and styling brand in Delhi NCR for Indian men aged about 18-30. This context is assumed, not externally verified.

The diagnosis

The failed baseline is best explained by content-system imbalance: 90% promotional and 91.3% static output concentrated in two topics, reinforced by repetitive or missing CTAs. The issue is not that every promotion underperformed; rather, the mix left too little room for the educational, saveable, community, and retention-led formats that can build repeat demand.

Interpretation guardrail

The video mean is 11.13% but falls to 6.56% after removing one extreme video. This is directional evidence for testing video, not a causal claim.

Verified baseline

Records	150
Formats	137 posts / 13 videos
Promotion	90.0%
Missing CTA	14
Views > reach	11

Qualitative Instagram discovery signal

The project owner reports finding BudgetFitzz on Instagram while actively searching and comparing multiple fashion products.

This is a positive discovery signal: BudgetFitzz surfaced during a high-intent product-research journey, suggesting that searchable product and styling content can contribute to account discovery.

Guardrail: This is one self-reported journey. It does not establish Instagram search ranking, population-level discoverability, reach, or conversion performance.

Recommended validation: Retain clear product-category and styling language in captions and on-screen copy, then validate the signal with Instagram discovery-source insights, profile visits, follows, product or link actions, and a short 'How did you find us?' response field.

Dataset provenance

User-provided local evaluation dataset; original provenance unspecified. It is not described as a genuine Instagram export.

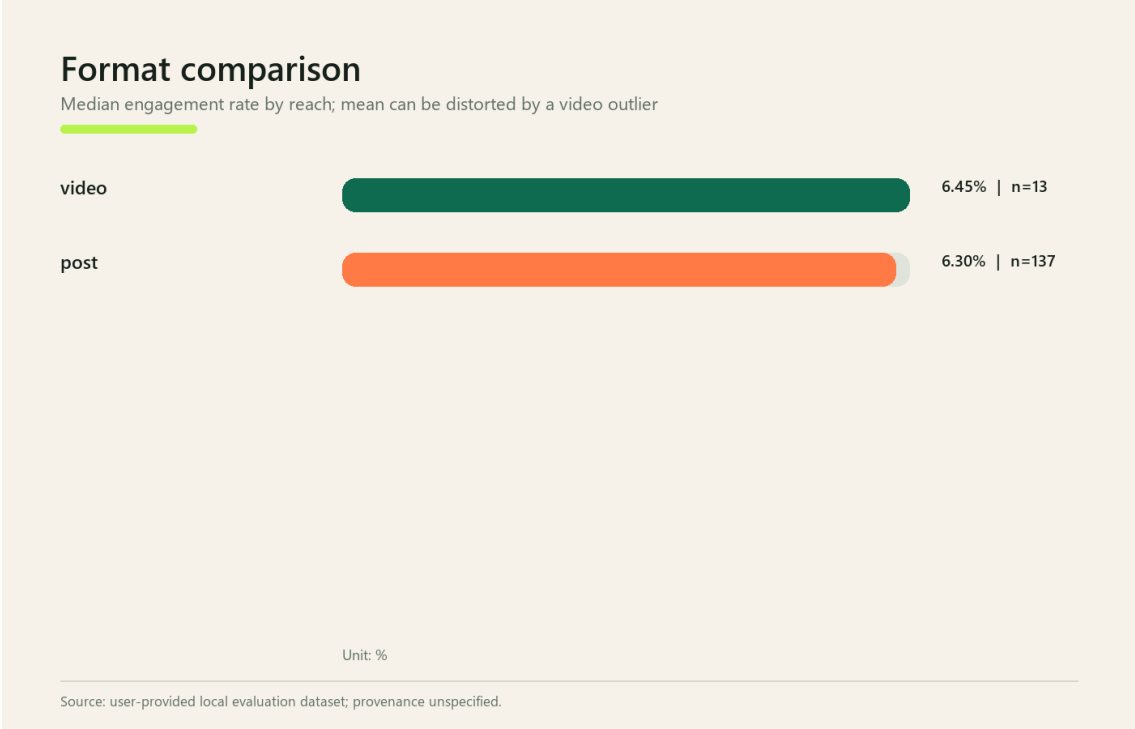

Metric contract

Engagements = likes + comments + shares + saves. Engagement rate by reach = engagements / reach x 100. Like, comment, share and save rates use reach. Frequency = impressions / reach. Average watch time = watch time / video plays. Retention proxy = average watch time / duration x 100. Weighted score uses 1x likes, 3x comments, 4x shares and 4x saves.

Robust analysis

Raw values are preserved. Group tables report n, median, quartiles, mean, 10% trimmed mean, 5% winsorized mean and 2,000-sample bootstrap median intervals. Static-post video fields remain unavailable. Views are plays. n<3 is anecdotal; n=3-4 directional; n>=5 is cautious.

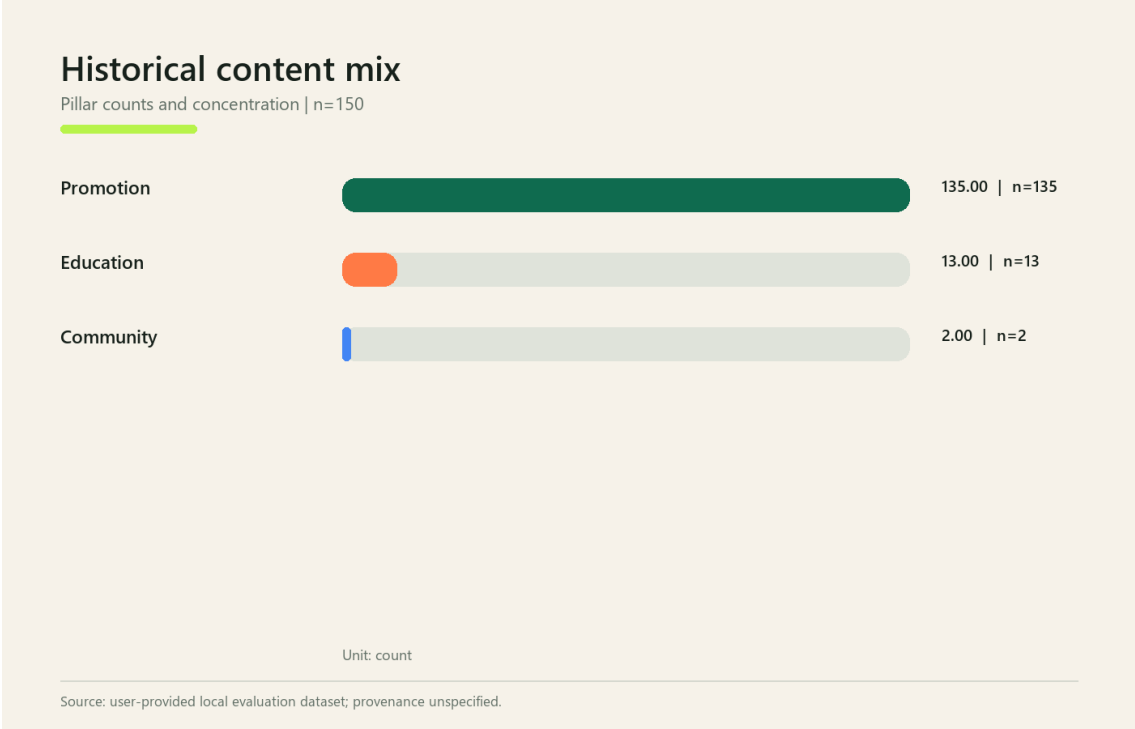

Format comparison

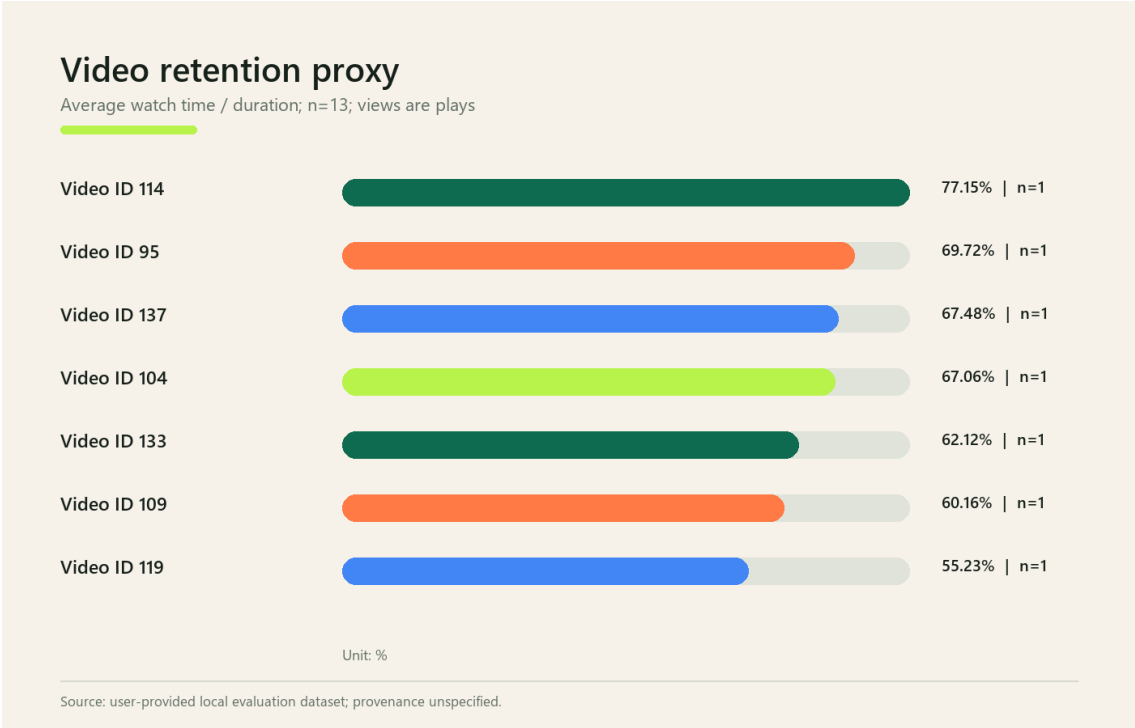

Pillar save-rate comparison

Historical content mix

Video retention proxy

Evidence register

ID	Finding and comparison	n / confidence
E01	The baseline is overwhelmingly promotional. 135 of 150 items	150 / robust
E02	Static posts dominate the tested format mix. 137 posts vs 13 videos	150 / robust
E03	Education is associated with materially stronger save behavior than promotion. Education 0.522% vs Promotion 0.232% (2.2x directional lift)	13 / cautious
E04	Video median engagement is only slightly above post median engagement. Video 6.447% (n=13) vs post 6.297% (n=137)	13 / cautious
E05	A single video makes the video mean misleading. ID 82; video mean 11.130% vs 6.556% without it	13 / cautious
E06	Topic selection is highly concentrated. Outfit Ideas + Budget Finds	150 / robust
E07	CTA hygiene and brand consistency need repair. 14 missing CTAs; 2 rows reference @aristostyling	150 / robust
E08	Video views are plays rather than unique users. 11 of 13 videos have views above reach	13 / cautious
E09	Existing videos leave room for stronger retention design. Median across 13 videos; proxy based on aggregate watch time / plays / duration	13 / cautious

Evidence-linked changes

Increase qualified saves, shares, profile actions, link-request comments, and repeat audience growth by making BudgetFitzz immediately useful.

E01

Cap promotional/value-first commercial items at 2 of 7; allocate 3 education and 2 community items.

Finding: Promotion occupies 90.0% of the baseline.

Success metric: Pillar mix compliance; education median save rate; qualitative comment coding.

Limitation: Strong concentration evidence; performance effect remains a forward test.

E03

Make the takeaway visible on-frame: formulas, checklists, comparisons, and avoidable mistakes.

Finding: Education median save rate is 0.522% vs promotion 0.232%.

Success metric: Save rate target 0.45-0.70% on education posts.

Limitation: Cautious association; no causal attribution.

E02,E04,E05

Use exactly two short videos with first-second hooks, 3-scene pacing, captions, and explicit end cards.

Finding: Posts are 91.3% of the baseline; video has n=13 and one extreme outlier.

Success metric: Retention proxy target 60-70% vs observed median 55.2%.

Limitation: Directional; views are plays and not unique reach.

E06

Add wardrobe systems, fit diagnosis, colour voting, and wardrobe-audit topics while retaining familiar commercial anchors.

Finding: Outfit Ideas and Budget Finds account for 66.7% of all records.

Success metric: No topic repeated more than twice in the seven-day cycle.

Limitation: Concentration is certain; audience response must be tested.

E07

Use one primary CTA per asset, rotate save/share/vote/link-request intents, and standardize @budgetfitzz.

Finding: Fourteen CTAs are missing and two rows use @aristostyling.

Success metric: 100% CTA coverage; 0 wrong-handle occurrences; at least 4 CTA styles across 7 items.

Limitation: Direct quality-control fix; behavioral lift is a hypothesis.

Five posts and two videos

DAY 1 / POST / 2026-07-17

3 pieces. 7 clean fits. No wardrobe haul.

Show one overshirt, one solid tee, and one dark trouser as a repeatable outfit system.

CTA: Save this 3-piece formula before your next purchase.

Evidence: E01 + E03: education is scarce but has a 2.2x higher median save rate than promotion.

Target: Save rate 0.50-0.70%; share rate 0.15-0.25% (targets, not observed results).

DAY 2 / VIDEO / 2026-07-18

One overshirt. Three small fit moves in 10 seconds.

Show three visible adjustments to one forest textured overshirt: wear it open, button it lightly, then check the collar, cuff, and hem.

CTA: Save the three fit moves and test them tonight.

Evidence: E02 + E05 + E09: video is under-tested; mean performance is outlier-driven and median retention is about 55%.

Target: Retention proxy 62-70%; engagement rate 6.5-8.0% (targets).

DAY 3 / POST / 2026-07-19

Date night: A, B or C? Pick one.

Three original outfit colourways with a bounded vote and one-line styling rationale.

CTA: Comment A, B or C plus the occasion.

Evidence: E01 + E06: only two community items exist and topic territory is concentrated.

Target: Qualified comments 1.2-2.0% of reach; share rate 0.15-0.25% (targets; community baseline is anecdotal).

DAY 4 / POST / 2026-07-20

INR 1,999 to look sharper: buy in this order.

Teach a prioritized basket: trouser first, solid tee second, overshirt third; show budget guardrails without claiming live prices.

CTA: Comment LINK for a shortlist built around the INR 1,999 cap.

Evidence: E01 + E07: retain commercial intent but make it useful and replace repetitive link bait with one explicit, qualified CTA.

Target: Link-request comments 0.8-1.5% of reach; save rate 0.35-0.55% (targets).

DAY 5 / VIDEO / 2026-07-21

A realistic fit check, from shoulder to shoe.

Use the visible balanced outfit to check the shoulder line, tee hem, and straight trouser line without claiming a before-and-after transformation.

CTA: Save the three visible fit checks and try them in the mirror.

Evidence: E03 + E09: education is more saveable and current video retention leaves room for faster, explicit progression.

Target: Retention proxy 60-68%; share rate 0.20-0.35% (targets).

DAY 6 / POST / 2026-07-22

One sneaker budget? Rank by use, not hype.

Rank neutral court, retro runner, and chunky sneaker by versatility, comfort, and outfit compatibility without using brand logos.

CTA: Comment SHOES with your budget and daily use case.

Evidence: E06: Sneaker Review has only five records while two topics dominate; test adjacent commercial utility.

Target: Qualified comments 0.7-1.3% of reach; save rate 0.35-0.55% (targets).

DAY 7 / POST / 2026-07-23

Before Sunday checkout: pass this 5-point audit.

A saveable checklist asking whether a purchase creates three outfits, fits now, and replaces a real gap.

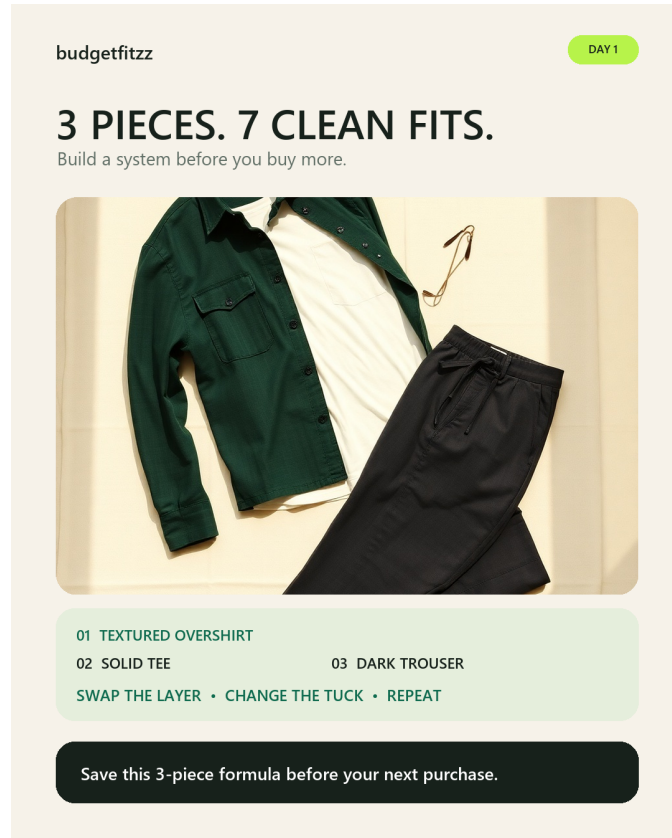

CTA: Save the audit and comment your hardest rule.

Evidence: E01 + E03 + E07: close with useful community interaction instead of another generic promotion or missing CTA.

Target: Save rate 0.50-0.75%; qualified comments 0.8-1.5% of reach (targets).

Observed baseline vs revised test design

Dimension	Observed baseline	Revised design
Content-pillar mix	Promotion 135/150 (90.0%); Education 13/150 (8.7%); Community 2/150 (1.3%)	Education 3/7 (42.9%); Community 2/7 (28.6%); Value-first commercial 2/7 (28.6%)
Format mix	post 137/150 (91.3%); video 13/150 (8.7%)	post 5/7 (71.4%); video 2/7 (28.6%)
Topic diversity	5 unique topics; top two 100/150 (66.7%)	7 unique topics across 7 items
Hook-style diversity	Dominant: Emotional / social 71/150 (47.3%)	3 styles: List / specificity 4; Question 2; Other 1
CTA coverage	Explicit CTA 136/150 (90.7%); missing 14	Explicit CTA 7/7 (100.0%) across 3 CTA styles
Education share	13/150 (8.7%)	3/7 (42.9%)
Community share	2/150 (1.3%)	2/7 (28.6%)
Education save rate	Median 0.522% (n=13)	0.50-0.75%
Video retention proxy	Median 55.2% (n=13)	60-70%
Publishing windows	19 observed posting hours	7 pre-registered date/time windows

Agent architecture, memory and retries

Eleven named agents operate through a persistent SQLite state machine. Pydantic validates boundaries. Each trace records run ID, agent, action, references, concise decision, evidence IDs, duration, status, error, retry, and tool. Human checkpoints are auto-approved only for this demo configuration and are logged.

GPU and local generation

NVIDIA GeForce RTX 4050 Laptop GPU | 6141 MiB | driver 581.86 | selected encoder h264_nvenc | meaningful GPU use True.

Spend

Direct revised-content generation spend is INR 0. Local tools and models are logged as free. Project subscriptions are separate from direct generation expense.

Limitations

The dataset is observational, imbalanced and provenance-unspecified. Outliers affect means; community n=2 is anecdotal; timing cells are uneven; views are plays; retention is a proxy; future values are targets, not achieved results.

Reproduction

Run setup.ps1, generate_submission.ps1, validate_submission.ps1 and run_app.ps1.

Final validation

PASS: 42 passed, 0 failed.

END OF REPORT
